Efficiency Ratios: Stock Turnover & Gearing Ratio

An Introduction to Efficiency Ratios

- Efficiency ratios show how well a business utilises its assets and liabilities to generate sales and maximise profits
- They can provide insights into the operational efficiency of a business, including
 - How well **stocks** are being managed
 - The time taken for a business to settle debts with its creditors
 - How well credit offered to customers is being controlled
 - The balance of business funding between loans and equity capital
- Stakeholders, such as investors, can use the ratios to assess how well a company manages its resources
- Management can use ratios to set targets for key staff

Diagram: The four main Efficiency Ratios

Efficiency ratios provide insights into the operational efficiency of a business

Stock Turnover

• The stock turnover ratio shows how well a business **converts its stock into sales**

Page 2 of 16

- Before calculating stock turnover it is first necessary to calculate the average value of stock held by a business in a given period
 - It is calculated using the formula

Average stock = $\frac{\text{Opening stock} + \text{Closing stock}}{2}$

Calculating the Stock Turnover Ratio

Stock turnover can then be calculated in two ways

1. Number of times a business sells all of its stock during a period (usually a year)

- Businesses aim for a high or increasing ratio
 - More stock sold means that it is generating profit more efficiently
 - Perishable goods are less likely to be wasted
- 2. Number of days taken to sell all of its stock

 $\frac{\text{Average Value of Stock}}{\text{Cost of Sales}} \times 365$

- Businesses aim for a **low or falling ratio**
- Selling stock quickly means profit is achieved swiftly
- Less likely to hold obsolete stock that may need to be sold at a loss

Worked Example

YakPur Fashions is a manufacturer and exporter of high quality fashion outerwear

A selection of YakPur Fashions' financial performance indicators are shown in the table

Selected Financial Performance Data 2022

YakPur Fashions

Page 3 of 16

	€
Stock held on 1st January 2022	47,600
Credit Sales Revenue	241,200
Cost of Sales	112,400
Stock held on 31st December 2022	26,000
Debtors on 31st December 2022	31,200
Creditors on 31st December 2022	28,500

(a) Calculate YakPur Fashions' stock turnover ratio for 2022

(i) in terms of the number of times stock was sold during the year

(ii) in terms of the number of days taken to sell all stock

(4 marks)

Step 1: Calculate the average value of stock

$$\frac{\text{Opening stock} + \text{Closing stock}}{2}$$
$$= \frac{\notin 47,600 + \notin 26,000}{2}$$
⁽¹⁾

= € 36,800

Step 2: Calculate the number of times stock sold during the year

Cost of sales Average stock

$$= \frac{\text{€ 112,400}}{\text{€ 36,800}}$$
 (1)

= 3.05 times

Step 3: Calculate the number of days taken to sell stock

SaveMyExams

$$\frac{\text{Average stock}}{\text{Cost of sales}} \times 365$$
$$= \frac{\notin 36,800}{\notin 112,400} \times 365$$
(2)
$$= 119.50 \text{ days}$$

Ways to improve the stock turnover ratio

• The stock turnover ratio can be improved by holding less stock or reducing cost of sales

Improving the Stock Turnover Ratio

Hold less stock	Reduce the cost of sales
 Reorder from suppliers more regularly 	 Seek lower-cost suppliers
 Implement a just-in-time stock management approach 	 Purchase in bulk to achieve purchasing economies of scale
 Dispose of obsolete stock 	 Reduce storage costs such as security
 Reduce the product range 	

Stock turnover variations

- There is **no ideal ratio** for stock turnover
 - Some businesses will have a very low stock turnover ratio as they sell few products usually at a high price
 - Examples include
 - Jewellers
 - Luxury vehicles
 - Specialist equipment or services
 - Other businesses have a very high stock turnover ratio
 - Their business model often requires this for example, they may sell **perishable** goods

Example include:

Page 5 of 16

- Save My Exams

- Supermarkets
- Florists
- Takeaway food businesses

Gearing Ratio

- The gearing ratio illustrates the long-term financial structure of the business
 - It shows the balance of non-current liabilities (e.g. long-term loans) to shareholder capital used to fund a business
 - The outcome is expressed as a percentage and is calculated with the following formula

Gearing Ratio = $\frac{\text{Non Current Liabilities}}{\text{Capital Employed}} \ge 100$

• Capital employed can be calculated by adding non-current (long term) liabilities to the equity

Interpreting the results

- If the outcome is less than 50% the business is low-geared
 - The business is largely funded by shareholder capital
- If the outcome is more than 50% the business is highly-geared
 - The business is largely funded by loan capital

Worked Example

The table shows an extract from the company accounts of Keals Cosmetics.

	\$
Current Assets	6.2 million
Current Liabilities	3.4 million
Non-current Liabilities	9.6 million
Capital Employed	43.3 million

Calculate Keals Cosmetics' gearing ratio

Page 6 of 16

(2 marks)

Step 1: Identify the data required to calculate the gearing ratio

Non-current liabilities = \$9.6 million

Capital employed = \$43.3 million

Step 2: Divide non-current liabilities by capital employed

 $43.3 \text{ million} \div 9.6 \text{ million} = 0.22$ (1)

Step 3: Multiple the outcome by 100 and express the result as a percentage

 $0.22 \times 100 = 22\%$ (1)

22% of Keals Cosmetics capital structure is made up of long-term loans

It is a low-geared business

Problems associated with high gearing

- The higher the gearing ratio the more dependent a business is on long-term borrowing
- High gearing can be problematic for several reasons

Risks Associated with High Gearing

Financial Risk	Cash Flow & Investment Constraints
 Rising interest rates are 	 High gearing strains cash flow
problematic	 During an economic downturn the business may
 If interest rates rise the cost of 	struggle to generate enough cash to pay debts
repaying loans rises	 High gearing limits funds for investments
 May put strain on the 	- Descerch and development, new projects or other
businesses finances	 Research and development, new projects or other growth opportunities may be unaffordable
 High gearing reduces profitability 	
 Large portion of revenue goes towards repaying debt 	

 May be better to reinvest /pay shareholder dividends 		Your notes
Investor Perception	Credit Rating Impact	
 High gearing is associated with financial risk Could make it difficult to attract investors May lead to a lower share price 	 High gearing can impact credit rating May mean higher interest rates on future borrowings Difficult to access additional funds 	

Situations where high gearing is less problematic

- When interest rates are low and expected to remain low
 - Interest rates in **Europe** have been historically low for more than a decade
 - Many businesses have taken advantage of borrowing cheaply to fund investment
- Large and profitable businesses are capable of meeting debt obligations
 - Multinational car manufacturers such as **Toyota** and **Volkswagen** are highly geared
 - High levels of borrowing have funded research into new generations of electric vehicles

Ways to improve gearing

- Improving gearing usually means lowering it
- This can be achieved by reducing long-term borrowing or raising more equity capital

Ways to Improve Gearing

Reduce Long-term Borrowing	Raise Equity Capital
 Repay existing debt to reduce the overall	 Raise share capital by issuing new shares or
debt burden	consider a rights issue
 Pay off high-interest debt first to minimise	 Retain profits instead of distributing profits as
interest costs	dividends
 Negotiate with creditors to restructure existing debt 	

Page 8 of 16

Examiner Tips and Tricks

High gearing should always be **balanced with the need to grow**

Without external finance many businesses would struggle to make crucial capital investments that could increase output, improve productivity or increase efficiency

Businesses need to carefully weigh up **how much debt it can manage** before it outweighs the benefits of growth

Efficiency Ratios: Debtor & Creditor Days

Debtor Days

- Debtor days measures the average number of days it takes for a business to collect money from its debtors
- Businesses often provide a period of trade credit to customers
 - In the UK 30 to 60 days is typical
 - The growth of promotional 'buy now, pay later' deals has increased the level of debtors for some businesses
- It is calculated using the formula

Debtor days =
$$\frac{\text{Debtors}}{\text{Total credit sales revenue}} \times 365$$

- Businesses aim for a low or reducing ratio
 - This indicates efficiency in collecting outstanding debts from credit customers
 - Collecting debts promptly can improve cash flow

Í

Worked Example

YakPur Fashions is a manufacturer and exporter of high quality fashion outerwear

A selection of YakPur Fashions' financial performance indicators are shown in the table

Selected Financial Performance Data 2022	
YakPur Fashions	
	€
Stock held on 1st January 2022	47,600
Credit Sales Revenue	241,200
Cost of Sales	112,400

Page 10 of 16

Stock held on 31st December 2022	26,000
Debtors on 31st December 2022	31,200
Creditors on 31st December 2022	28,500

(2 marks)

Step 1: Divide debtors by credit sales revenue

€ 31,200 € 241,200 (1)

= 0.1294

Step 2: Multiply the outcome by 365

(1)

 0.1294×365

= 47.23 days

• It takes YakPur Fashions an average of 47.23 days to collect money owing from debtors

Ways to Reduce the Debtor Days Ratio

• Maintaining **open communication** with customers helps to address any issues promptly

Ways to Reduce the Debtor Days Ratio

Method	Explanation
Streamline invoicing and credit control processes	 Send out invoices promptly Clearly outline payment terms and due dates on invoices Send reminders before and after the due date to prompt timely payments Have a systematic approach for handling overdue accounts including follow-up procedures

Your notes

Establish and monitor creditworthiness of customers	 Conduct credit checks on customers - especially before extending trade credit
	 Set appropriate credit limits based on the customer's financial health
	Keep a close eye on customer payment patterns
	 Periodically review and adjust trade credit terms
	 Implement an effective system for tracking and managing debtors
Improve payment systems	 Make it easy for customers to pay by offering various payment methods
	 Use accounting software or automation tools to streamline invoicing and payment processes
Provide incentives for early payment	 Encourage customers to pay before an invoice's due date by providing discounts or other incentives such as free delivery

 If these methods fail to persuade customers to pay their invoices on time a business has a range of further options. These methods should be pursued with caution as relationships with customers may be damaged

Method	Explanation
Refuse to provide further goods unless outstanding debts are paid	 Suspend the despatch of an order until an outstanding payment is received Refuse to accept further orders
Threaten to take legal action	 In the UK small businesses can make use of the Small Claims Court to recover modest debts from customers

Creditor Days

- Creditor days measures the average **number of days** a business takes to **pay its creditors**
- It is calculated using the formula

SaveMyExams

Creditor days = $\frac{\text{Creditors}}{\text{Cost of sales}} \times 365$

- Businesses generally aim for a high or increasing ratio
 - This indicates skills of negotiation in arranging extended credit terms with suppliers
 - Delaying payments to suppliers can improve cash flow
- However, taking longer than agreed to pay outstanding invoices may have negative consequences
 - **Relationships** with important suppliers may worsen
 - They are less likely to extend further trade credit
 - Penalties may be issued for late payment
 - Orders may be delayed until payment is received
 - Creditworthiness may worsen
 - A business may fail credit checks
 - Unable to place orders with other suppliers
 - Less chance of obtaining trade credit elsewhere
 - Could impact applications for borrowing e.g. loans

Worked Example

YakPur Fashions is a manufacturer and exporter of high quality fashion outerwear

A selection of YakPur Fashions' financial performance indicators are shown in the table

Selected Financial Performance Data 2022 YakPur Fashions	
Stock held on 1st January 2022	47,600
Credit Sales Revenue	241,200
Cost of Sales	112,400

Your notes

Page 13 of 16

	Stock held on 31st December 2022	26.000
		20,000
	Debtors on 31st December 2022	31,200
	Creditors on 31st December 2022	28,500

(a) Calculate YakPur Fashion's Creditor Days ratio for 2022

(2 marks)

Step 1: Divide creditors by cost of sales

€ 28,500 € 112,400 (1)

= 0.2536

Step 2: Multiply the outcome by 365

(1)

 0.2536×365

= 92.56 days

Yakpur takes an average of 92.56 days to settle supplier invoices

Ways to Improve the Creditor Days Ratio

• Larger businesses often employ a credit controller to manage negotiations about payments with their suppliers. This person has a range of methods which they can use to improve the creditor days ratio

Improving the Creditor Days Ratio

Method	Explanation
Develop close relationships with suppliers	 Communicate regularly with named individuals and provide feedback Avoid confrontation if conflicts arise

Page 14 of 16

Your notes

Improve the businesses credit rating	 Make payments in full within the trade credit period 	
	 Make prompt payments on other forms of credit such as loans or credit cards 	
Seek suppliers that offer extended trade credit terms	 Approach suppliers and negotiate for extended payment terms 	
	 Highlight strong payment history and the value of ongoing business in negotiations 	

Examiner Tips and Tricks

Improving debtor and creditor days should have a positive impact on business liquidity – and improve the working capital situation too

As a result making efforts to take the steps outlined above can improve the stability of a business and increase its chances of survival

Insolvency Versus Bankruptcy

- Insolvency refers to the inability of a business to pay debts and continue trading
- Bankruptcy occurs when a business ceases to trade and the value of its possessions are distributed to its creditors
- The outcome of insolvency depends on the **ownership type** of the business

Diagram: comparing bankruptcy and liquidation

Save My Exams

Head to <u>www.savemyexams.com</u> for more awesome resources

- Liquidation involves the selling of business assets to settle outstanding debts and dissolve a company
- Administration protects businesses from administration whilst it attempts to settle debts and continue trading
 - If administration fails a company faces liquidation
